### A combinatorial approach to the algebra of hypermatrices

By analogy to the matrix case, the Konig directed tripartite hypergraph yields a combinatorial interpretation of the Bhattacharya-Mesner productoperation. The hypergraphcomposition is definedbythe following vertex and

Summing over  $(x_1, \dots, x_m)$  yields (5), which together with (4) and (3) yields  $\text{weight}(M) = \text{left-hand side of (2)}$  We will now prove that  $\text{weight}(M) = 1$ , and thus complete the proof.Let's defi- -: mapping from  $M$  to  $M$  as follows A combinatorial approach to matrix algebra 65 Given a pair  $(G, H)$ , start at vertex 1 and walk along  $G$  in such a way that you always choose the top edge.

The combinatorial interpretation of the inverse matrix We have seen that the matrix  $C$  is a Riordan array and the set of all Riordan matrices is a group, then the inverse matrix of  $C$  exists. In this subsection we will study the combinatorial interpretation of the unsigned inverse matrix of  $C$  by means of plane increasing trees.

This book, first published in 1991, is devoted to the exposition of combinatorial matrix theory. This subject concerns itself with the use of matrix theory and linear algebra in proving results in combinatorics (and vice versa), and with the intrinsic properties of matrices viewed as arrays of numbers rather than algebraic objects in themselves.

This sort of growth is known as the combinatorial explosion. For example, calculating a  $10 \times 10$  matrix using elementary products would require the computation of  $10! = 3628800$  elementary products - something that is definitely not practical.
