Step 3. Determine the piping geometry factor (F_P) and the liquid pressure recovery factor (F_{LP}). For these calculations, an estimated C_V value and the corresponding F_L is used. F_P is a correction factor that accounts for pressure losses due to piping fittings such as reducers, elbows, or tees that might be attached directly to the inlet and outlet connections of the control valve to be sized.

Reading sailing forums lead me to Corrosion-X as both a rust remover and preventer. I could not believe most of the stories I read about Corrosion-X being used on submerged steel and still preventing rust, or how it took of years worth of rust after 24 hour of soak time. It turns out that all the reviews and claims about Corrosion-X are true.

Corrosion control of metals is of technical, economical, environmental, and aesthetical importance. The use of inhibitors is one of the best options of protecting metals and alloys against corrosion. The environmental toxicity of organic corrosion inhibitors has prompted the search for green corrosion inhibitors as they are biodegradable, do not contain heavy metals or other toxic compounds.

Iron is essential for both alloys because it provides added resistance to corrosion caused by velocity effects called impingement attack. Figure 1 shows the effect of iron content on the impingement attack on 90-10 Cu-Ni from 30-day tests obtained at 3 m/s water velocity. This is taken from the data compiled by various authors and different test facilities. A distinct minimum is apparent.

Because Art. 800 has its roots in telephone technology, it addresses telephone and related systems that use twisted-pair wiring. The telephone utility typically provides the twisted-pair cable to a terminal board. This board usually is part of an assembly referred to as the network interface device (NID). Normally, you will find the NID at the point of entrance (Sidebar on page 56).
