### ELEMENTS OF RESERVOIR SIMULATION

Reservoir simulation is an area of reservoir engineering in which computer models are used to predict the flow of fluids (typically, oil, water, and gas) through porous media. Under the model in the broad scientific sense of the word, they understand a real or mentally created structure that reproduces or reflects the object being studied.

### Fundamentals of Reservoir Simulation

Reservoir Simulation is a field developed in petroleum engineering where it utilizes porous media in computer modeling to estimate the fluids dynamics, its goal is to predict the field performance under varies producing strategies. Reservoir Simulation is grounded on recognized engineering equations, engineers started calculating reservoir engineering with basic mathematical model long before the emergence of modern technology.
