Psoriasis - Wikipedia

The cause of psoriasis isn't fully understood, but it's thought to be related to an immune system problem with T cells and other white blood cells, called neutrophils, in your body. T cells normally travel through the body to defend against foreign substances, such as viruses or bacteria.

PubMed Central (PMC)

Psoriasis is a genetically transmitted disorder. The mode of inheritance is not well understood. The risk of developing psoriasis is 41% in individuals whose both parents are affected and 14% when only one parent is affected. There is also a concordance of psoriasis of up to 73% in monozygotic twins [2].
