An event-related potential (ERP) is the measured brain response that is the direct result of a specific sensory, cognitive, or motor event. More formally, it is any stereotyped electrophysiological response to a stimulus. The study of the brain in this way provides a noninvasive means of evaluating brain functioning.. ERPs are measured by means of electroencephalography (EEG).

The (keyup) event is your best bet. Let's see why: (change) like you mentioned triggers only when the input loses focus, hence is of limited use. (keypress) triggers on key presses but doesn't trigger on certain keystrokes like the backspace. (keydown) triggers every time a key is pushed down. Hence always lags by 1 character; as it gets the element state before the keystroke was registered.
