### Development of solid propellant technology in India

A high energy density green solid propellant will be developed and compared with state of the art solid propellants with respect to safety, performance and cost, to determine if replacing AP with ADN/AN is a feasible option. The results will serve as important input for decision makers when considering development of future European launch systems.

The development of solid propellants was accompanied by the development of insulation materials. From a strictly mechanical point of view, only the polybutadiene and cross-linked double base (XLDB) propellants can be used for case-bonded grains because of their good mechanical resistance during firing at low temperatures.

further aided large-missile technology. These separate lines of research led to the development of large solid-propellant motors and boosters. Many more discoveries went into the development of large solid-propellant motors. Ammonium perchlorate replaced potassium perchlorate as an oxidizer in the late 1940's, and binders were developed.

### Development Of Solid Propellant Technology In India

A solid-propellant rocket or solid rocket is a rocket with a rocket engine that uses solid propellants (fuel/oxidizer). The earliest rockets were solid-fuel rockets powered by gunpowder; they were used in warfare by the Chinese, Indians, Mongols and Persians, as early as the 13th century. All rockets used some form of solid or powdered propellant up until the 20th century, when liquid ...

Development of rockets. The technology of rocket propulsion appears to have its origins in the period 1200–1300 in Asia, where the first "propellant" (a mixture of saltpetre, sulfur, and charcoal called black powder) had been in use for about 1,000 years for other purposes. As is so often the case with the development of technology, the early uses were primarily military.
