In this lab exercise, you will investigate enzyme function. Enzymes are large protein molecules (i.e. macromolecules) that act as catalysts in the biochemical reactions that occur in living things. A catalyst is a specific type of protein that increases the rate of a chemical reaction that would otherwise occur too slowly.

Explanation: . The Michaelis constant, K_m , is not equal to K_s , but is rather the substrate concentration when the reaction rate is $\frac{1}{2} V_{max}$. K_m is an inverse measure of a substrate's affinity for the enzyme. So as the affinity decreases, K_m increases. Enzyme specificity is measured by a different constant, K_i , the specificity
