This comprehensive revision begins with a review of static electric and magnetic fields, providing a wealth of results useful for static and time-dependent fields problems in which the size of the device is small compared with a wavelength. Some of the static results such as inductance of transmission lines calculations can be used for microwave frequencies.

Electromagnetic radiation is used for communications and transmission of information. The waves that are used in this way are radio waves, microwaves, infrared radiation and light. The idea of using a signal lamp to communicate was used in the 19th century. This method of long distance communication needed a code.

Electromagnetic waves travel in a transverse form. Electromagnetic waves are not deflected by electric or magnetic field. These waves can be polarized. Electromagnetic Waves undergo interference and diffraction. The wavelength(λ) and frequency (ν) of the EM waves can be related as: $c = \nu \cdot \lambda$. where c = velocity of the wave.
