In arithmetic sequences, the common difference is simply the value that is added to each term to produce the next term of the sequence. When solving this equation, one approach involves substituting 5 for to find the numbers that make up this sequence. For example, so 14 is the first term of the sequence.

## Geometric Sequences and Series Date Period

When I think of a geometric sequence, I think of something where the initial input value = 1, not 0. Most interest problems would start at time = 0, so I would exclude these unless you said something like "let  $x = \$$  in bank at beginning of each year". Then your first input value would be 1.

## Geometric Tools (Important Maths Tools and it Uses)

A Geometric series is a series with a constant ratio between successive terms. The first term of the series is denoted by  $a$  and common ratio is denoted by  $r$ . The series looks like this :-  $a, ar, ar^2, ar^3, ar^4, \dots$ . The task is to find the sum of such a series.
