Quorum sensing in prokaryotic biology refers to the ability of a bacterium to sense information from other cells in the population when they reach a critical concentration (i.e. a Quorum) and communicate with them. The "language" used for this intercellular communication is based on small, self-generated signal molecules called as autoinducers.

## **Mastering A&P Ch.19.1-19.4 Flashcards | Quizlet**

Thyroid hormones are two hormones produced and released by the thyroid gland, namely triiodothyronine (T<sub>3</sub>) and thyroxine (T<sub>4</sub>). They are tyrosine-based hormones that are primarily responsible for regulation of metabolism. T<sub>3</sub> and T<sub>4</sub> are partially composed of iodine. A deficiency of iodine leads to decreased production of T<sub>3</sub> and T<sub>4</sub>, enlarges the thyroid tissue and will cause the disease known ...

## **A & P Chapter 13 Flashcards | Quizlet**

The endocrine system is a chemical messenger system comprising feedback loops of hormones released by internal glands of an organism directly into the circulatory system, regulating distant target organs. In humans, the major endocrine glands are the thyroid gland and the adrenal glands. In vertebrates, the hypothalamus is the neural control center for all endocrine systems.

## **Chapter 13/14 Flashcards | Quizlet**

Many studies with radioiodine have confirmed the accelerated physiologic activity of the thyroid in Graves' disease. Thus, labeled hormones appear as plasma Protein Bound  $^{131}\text{I}$  more rapidly and reach higher levels than in normal persons after administration of  $^{131}\text{I}$ . The rate of turnover of plasma hormones is also increased.

After an hour, \_\_\_ percent of the original number of molecules remain. 12.5.  
Norepinephrine and epinephrine are amines.

### **Thyroid hormones - Wikipedia**

Hormones produced by the \_\_\_ are derived from molecules to which iodine atoms have been attached Thyroid gland  
Increased levels of the hormone \_\_\_ will lead to decreased levels of calcium ions in the blood

### **Endocrine system - Wikipedia**

Hormones are also regulated by receptor agonists. Hormones are ligands, which are any kinds of molecules that produce a signal by binding to a receptor site on a protein. Hormone effects can be inhibited, thus regulated, by competing ligands that bind to the same target receptor as the hormone in question.

## **Hormone - Wikipedia**

The thyroid gland is the first endocrine gland to develop in the embryo and begins to form about 24 days after fertilization. Like Rathke's pouch, that develops into the anterior pituitary gland (see Box 7.2), the thyroid gland also develops from an outgrowth of the pharyngeal endoderm. As the embryo grows the thyroid gland descends into the ...
