The physics of springboard diving is different than the physics of platform diving, but in many ways they are similar. A platform diver must generate upward and forward momentum off the platform by bending the knees (almost like loading a spring) and pushing off the hard platform surface with toes, ankles, knees and hips, while also using arm swings and/or a running approach to generate more height and flip.

Causality is the relationship between causes and effects. It is considered to be fundamental to all natural science - especially physics. Causality is also a topic studied from the perspectives of philosophy and statistics. From the perspective of physics, causality cannot occur between an effect and an event that is not in the back light cone of said effect. Similarly, a cause cannot have an effect outside its front light cone.
