### **Naming Ionic Compounds Worksheet One | Briefencounters**

Compounds containing polyatomic anions are named using the Type I or Type II naming systems illustrated above. For example, the sodium salt of nitric acid is sodium nitrate ( $\text{NaNO}_3$ ). If you recognize the acid formula you will always get the correct anion formula and its charge, since the charge is equal to the number of ionizable hydrogen atoms in the acid, and is always negative.

## Naming ions and chemical compounds

When naming ionic compounds we simply name the cation (the positive ion) then the anion (the negative ion). The cations generally retain the name of the element, so  $\text{Na}^+$  is named sodium. The monatomic anions are formed when a non-metal gains an electron and these ions have an -ide ending, so  $\text{S}^{2-}$  is named sulfide.
