In computer engineering, Halt and Catch Fire, known by the assembly mnemonic HCF, is an idiom referring to a computer machine code instruction that causes the computer's central processing unit (CPU) to cease meaningful operation, typically requiring a restart of the computer. It originally referred to a fictitious instruction in IBM System/360 computers (introduced in 1964), making a joke ...

Fire is the rapid oxidation of a material in the exothermic chemical process of combustion, releasing heat, light, and various reaction products. Fire is hot because the conversion of the weak double bond in molecular oxygen, O_2 , to the stronger bonds in the combustion products carbon dioxide and water releases energy (418 kJ per 32 g of O_2); the bond energies of the fuel play only a minor ...

Halt and Catch Fire (computing) - Wikipedia

When you expose sugar to an open flame, it will burn quickly and react with the oxygen in the air. This is called a combustion reaction. The end products are carbon dioxide (CO_2) and water (H_2O). A different reaction happens if there is not enough oxygen present during the combustion to form CO_2 . In this case, the sugar decomposes ...
