Blocking Mechanisms - BAS Blocking After Service: I After a job completion at queue i , if the job attempts to enter to queue j which has reached the capacity constraint B_j , then it is forced to wait at i , i.e. queue i is blocked. When a space becomes available at j , the job goes to queue j and service at queue i is resumed. I It is possible that (at least) two job attempt to enter a

Exact solutions for networks of queues with blocking-after-service 129 We have shown that if whenever a station is full there is at most one job outside that station that may try to enter it, the equilibrium state probabilities of a queueing network with BAS have a simple relation to the corresponding probabilities for the same network without blocking.

Queueing Networks with Blocking - An Introduction

A survey of exact and approximate methods for closed queueing networks with blocking has been recently presented by Onvural in [31]. Open queueing networks with blocking and a bibliography on networks with finite capacity queues have been presented by Perros [34, 35].
