Weather vs. Climate - Mrs. Eagan's Third Grade Classroom

Weather is the present condition of a place with respect to the atmospheric pattern determining the pressure, precipitation and hotness or coldness of that area.it is determined by the temperature, humidity, rainfall, wind speed etc. Sun is the most influencing factor of the weather. Climate is the average weather pattern of a place taken over a period of 25 years.

UCSB Science Line

Clouds are the key element of the water cycle, since they are the transporters that move water from one place on Earth to another. They are also important in determining how much of the Sun's energy is absorbed and trapped in the atmosphere. They are thus very important in altering the temperature of the air and Earth's surface.

Climate Change Indicators: Weather and Climate | US EPA

Even as climate change raises average global temperatures, that doesn't spell the end of winters. Overall, winters are getting milder and shorter, but recent winters have brought intense snowstorms and record-breaking frost. While it may seem contradictory, climate change may be contributing to more extreme winter weather.

What Is Climate Change? | NASA Climate Kids

CBC Understands the Difference Between Weather and Climate ...

Weather is a specific event—like a rain storm or hot day—that happens over a short period of time. A weather forecast can tell you what the weather will be like in a few hours or days from now. Climate, on the other hand, is the average weather conditions in a place over a long period of time—30 years or more.How do scientists predict what Earth's climate will be like in the future?

Weather Wiz Kids | Because weather is awesome

The answer from the study was "no". But, as a foreword from that year's BAMs report explains: "Given the numerous ways climate change could influence precipitation in this region, a 'no' result for the role of Arctic sea ice should not be interpreted as an absence of any role at all for climate change."
